USA Workforce Analytics

Power BI Dashboard Analysis & Decision-Making Report

Prepared for data analytics portfolio publication | November 2026

Executive Summary

This report analyses the workforce composition and overtime patterns shown in a Power BI dashboard covering 500 employees across five departments and four US states. The dashboard displays approximately 62,000 overtime hours and a calculated overtime-per-employee measure of 124.10. HR has the highest headcount (105), California the largest state workforce (148), and Operations the highest displayed overtime (approximately 12.7K hours). These observations highlight areas for further workload and staffing investigation; they do not by themselves establish causes or inefficiency.

1. Objectives and Scope

Assess employee distribution by department, state and employment type; describe departmental overtime; identify potential workforce planning questions; and demonstrate Power BI reporting and DAX measures. Source: the one-page exported dashboard, “USA Workforce Analytics”. Underlying records, definitions and data-cleaning history were not supplied for independent validation.

2. Dashboard KPI Summary

Metric	Displayed value
Total employees	500
Average hours worked	1.45K (period/definition not stated)
Total overtime DAX	62K (rounded display)
Overtime per employee	124.10
Full-time employees	241 (48.2%)
Part-time employees	259 (51.8%)

3. Workforce Distribution

By department: HR 105 (21.0%); Customer Support 104 (20.8%); Technology 100 (20.0%); Finance 96 (19.2%); Operations 95 (19.0%). Departmental headcounts sum to 500.

By state: California 148 (29.6%); New York 129 (25.8%); Texas 116 (23.2%); Ohio 107 (21.4%). State headcounts sum to 500.

Employment mix: 259 part-time employees (51.8%) and 241 full-time employees (48.2%). The near-even mix warrants consideration when comparing workloads and overtime, but the dashboard does not show overtime by employment type.

4. Overtime Analysis

Displayed departmental overtime, rounded: Operations 12.7K; HR 12.6K; Technology 12.5K; Customer Support 12.4K; Finance 11.8K hours. Operations leads in total overtime despite having the smallest departmental headcount (95). This suggests a useful investigation into overtime intensity per employee, schedules and operational demand; it does not establish a staffing shortage.

The five rounded department figures sum to approximately 62.0K, consistent with the rounded dashboard KPI. The separate overtime-per-employee measure is 124.10. Because the total is rounded, the exact underlying DAX value cannot be reconstructed from the PDF alone.

5. Methods and Limitations

The provided evidence is a one-page Power BI export with bar charts, a doughnut chart, KPI cards and a department slicer. The dashboard labels two overtime measures as DAX. Exact DAX expressions, transformation steps, raw-data quality checks, the reporting period, and whether “Average Hours Worked” is a sum, average or other aggregation cannot be confirmed from the export. This report therefore does not claim specific cleaning operations or DAX formulas were performed.

6. Recommendations for Decision-Makers

- Review Operations overtime per employee, not just total hours, and compare against workload and staffing levels.
- Break down overtime by full-time versus part-time status, state, role and month to locate concentrated patterns.
- Define the time period and unit for “Average Hours Worked”; audit the aggregation and relabel the KPI if necessary.
- Add overtime rate, absence, turnover and labour cost metrics where data are available to support decisions.
- Validate DAX measures against underlying rows before using the dashboard for workforce policy or budgeting.

7. Suggested Next Dashboard Improvements

Add a reporting-period subtitle, a data dictionary, an overtime-per-employee departmental visual, time-trend analysis, and a definitions/quality-check page. Keep slicer interactions consistent across visuals and clearly label units.

Conclusion

The dashboard demonstrates a useful initial workforce overview with balanced departmental headcounts and meaningful overtime variation. The most actionable next step is to investigate why Operations has the highest total overtime while employing the fewest people, using normalised metrics and additional context. Findings should be treated as descriptive until the underlying dataset and measure definitions are reviewed.
